Project Creation and Survival via Value Management

**** Insights by International Experts ****

Value Management (VM) has been used since 1947 in America by the clients and the project delivery teams to obtain optimum value for each dollar spent. Apart from the cost savings in the range of 10-15 % for most projects, VM can also support the project team to create innovative ideas *via* the systematic job plan (i.e., information, analysis, creative, evaluation, and development phases). Hence, we should not only acquire technical knowledge but must also develop various management skills for achieving the primary goals. The international VM Conference and the interactive Workshop will present the systematic logical VM, its dynamic team decision-making process, the concept of VM in various cities, and the approach by successful VM facilitators in international VM applications.

In fact, a project may not be feasibly created if there is insufficient support by stakeholders or insufficient justification of the objectives of the project. A project may not survive if there is budget overrun due to increased design requirements, unexpected cost escalations, lowering of market demands, contractual conflicts, etc., during its design or implementation. **Value methodology can be applied to help project creation and survival. International VM experts & local VM experts have been invited** to share their various valuable VM experiences in project creation and survival internationally and locally.
